Symbols in **blue font** are lexical tokens (terminals), symbols in regular font are either meta-symbols or non-terminals. Here is the meaning of the meta-symbols ( $\epsilon$  matches the empty input):

$( a )$	=	$a$	
$a b$	=	$a$ then $b$	(concatenation)
$a   b$	=	either $a$ or $b$	(alternation)
$[ a ]$	=	$a   \epsilon$	(optionality)
$\{ a \}$	=	$a   a a   a a a   \dots$	(repetition)
$\{ a , \}$	=	$a   a , a   a , a , a   \dots$	
$\{ a ; \}$	=	$a   a ; a   a ; a ; a   \dots$	
$\{ , a \}$	=	$\epsilon   a   a , a   a , a , a   \dots$	

query	::= { <b>declare variable</b> var [ <b>as</b> type ] <b>:=</b> e   <b>declare function</b> qname ( { var [ <b>as</b> type ] , } )   [ <b>as</b> type ] { e }   <b>declare view</b> qname ( { , var } ) { e }   e ; }	(a variable declaration)  (a function declaration) (a macro declaration) (an XQuery)
qname	::= [ <b>id</b> : ] <b>id</b>	(a qualified name is namespace:localname)
var	::= <b>\$ id</b>	(variables should begin with \$)
type	::= qname [ ( [ qname   * ] [ , qname ] ) ] [ *   +   ? ]	(XQuery type)
e	::= ( <b>for</b> fbinds   <b>let</b> lbinds ) { <b>for</b> fbinds   <b>let</b> lbinds }   [ <b>where</b> e ] [ <b>orderby</b> ] <b>return</b> e   <b>some</b> fbinds <b>satisfies</b> e   <b>every</b> fbinds <b>satisfies</b> e   <b>if</b> e <b>then</b> e <b>else</b> e   <b>insert</b> e <b>into</b> e   <b>delete from</b> e   <b>replace</b> e <b>with</b> e   @ step predicates   step predicates { path }   element   e binop e   unop e   e <b>instance of</b> type   e <b>cast as</b> type   e <b>castable as</b> type   <b>typeswitch</b> ( e ) typecases   <b>integer</b>   <b>double</b>   <b>string</b>	(FLOWR expression) (existential quantification) (universal quantification)  (insert the former inside the latter) (remove from parent) (replace the former with the latter)  (an XPath path) (element construction) (binary operation) (unary operation) (type check) (type cast) (can be cast to type?) (type switch) (integer constant) (floating point)
fbinds	::= { var [ <b>at</b> var ] <b>in</b> e , }	(for-bindings)
lbinds	::= { var <b>:=</b> e , }	(let-bindings)
orderby	::= <b>order by</b> { e [ <b>ascending</b>   <b>descending</b> ] , }	(default is ascending)
typecases	::= { <b>case</b> type <b>return</b> e } <b>default return</b> e	(type cases)
binop	::= <b>to</b>   <b>+</b>   <b>-</b>   <b>*</b>   <b>div</b>   <b>idiv</b>   <b>mod</b>   <b>=</b>   <b>!=</b>   <b>&lt;</b>   <b>&lt;=</b>   <b>&gt;</b>   <b>&gt;=</b>   <b>&lt;&lt;</b>   <b>&gt;&gt;</b>   <b>is</b>   <b>eq</b>   <b>ne</b>   <b>lt</b>   <b>le</b>   <b>gt</b>   <b>ge</b>   <b>and</b>   <b>or</b>   <b>not</b>   <b>union</b>   <b>intersect</b>   <b>except</b>	
unop	::= <b>+</b>   <b>-</b>   <b>not</b>	
element	::= < qname { qname = <b>string</b> } > content </ qname >   < qname { qname = <b>string</b> } />   <b>element</b> ( qname   { e } ) { { e , } }   <b>attribute</b> ( qname   { e } ) { { e , } }	(empty element)
content	::= { { { e , } }   <b>string</b>   <b>text</b>   element }	
path	::= / step predicates   // step predicates   /@ step predicates   //@ step predicates   /.. predicates	(child-of) (descendant-of) (attribute-of) (descendant-attribute-of) (parent-of)
predicates	::= { [ e ] }	
step	::= var   qname [ <b>::</b> ( qname   * ) ]   .   *   ( { , e } )   qname ( { , e } )	(an XPath step is axis::test) (current context) (any name) (sequence construction) (function call)
